GHL AI Studio: Build a Page and Connect the Form to Your CRM

Nov 10, 2026 · @Louie

What AI Studio is

AI Studio is GoHighLevel's prompt-to-app builder: you describe a page or app in plain words and it writes, previews and publishes it for you. It sits in the left menu of a sub-account as **AI Studio (Beta)**, between Payments and AI Agents.

What you can build	Example
Landing pages and websites	A booking page for a restaurant, a quote page for a roofer
Dashboards and tools	A job tracker, a calculator, a client portal
Stores and checkout pages	Built-in checkout; each sale creates the contact and order in the CRM
Full-stack apps	Database, logins and file storage with Cloud; server functions, REST APIs and a secrets vault

- **Home screen:** a prompt box ("Describe what you want to build..."), your projects, and templates such as Landing page, Dashboard, E-commerce, Restaurant / Food Ordering and Calendar / Scheduling.
- **Analytics and Submissions:** sites built in AI Studio now show visits and form submissions inside the project.
- **Forms and workflows:** a project's form can be tracked and used as a workflow trigger, so a submission lands in Contacts and starts your automation.

As of the in-app changelog (Sep to Oct 2026). It is still Beta, so menu names can change.

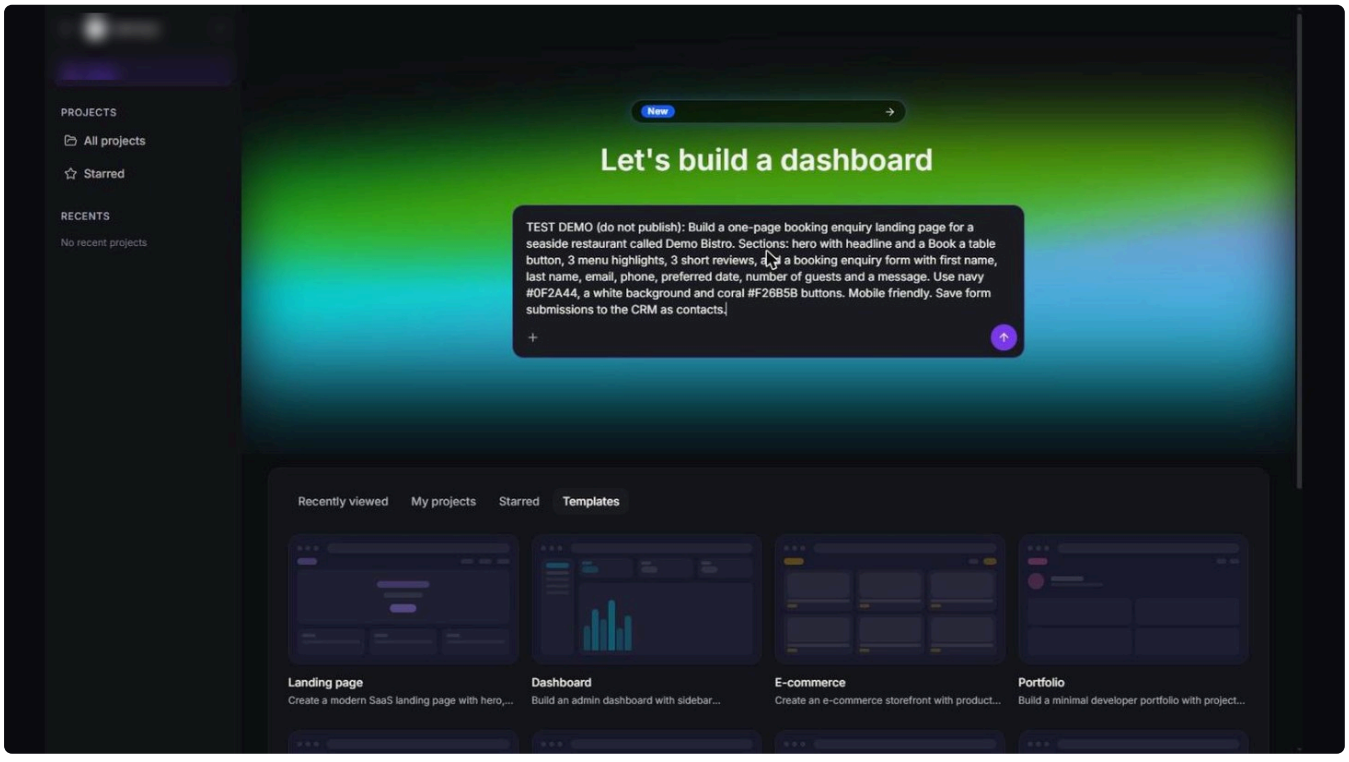

Step by step: build a page from a prompt

This is the exact path we followed in a test sub-account for the episodes. The test project was called Demo Bistro Booking and was never published.

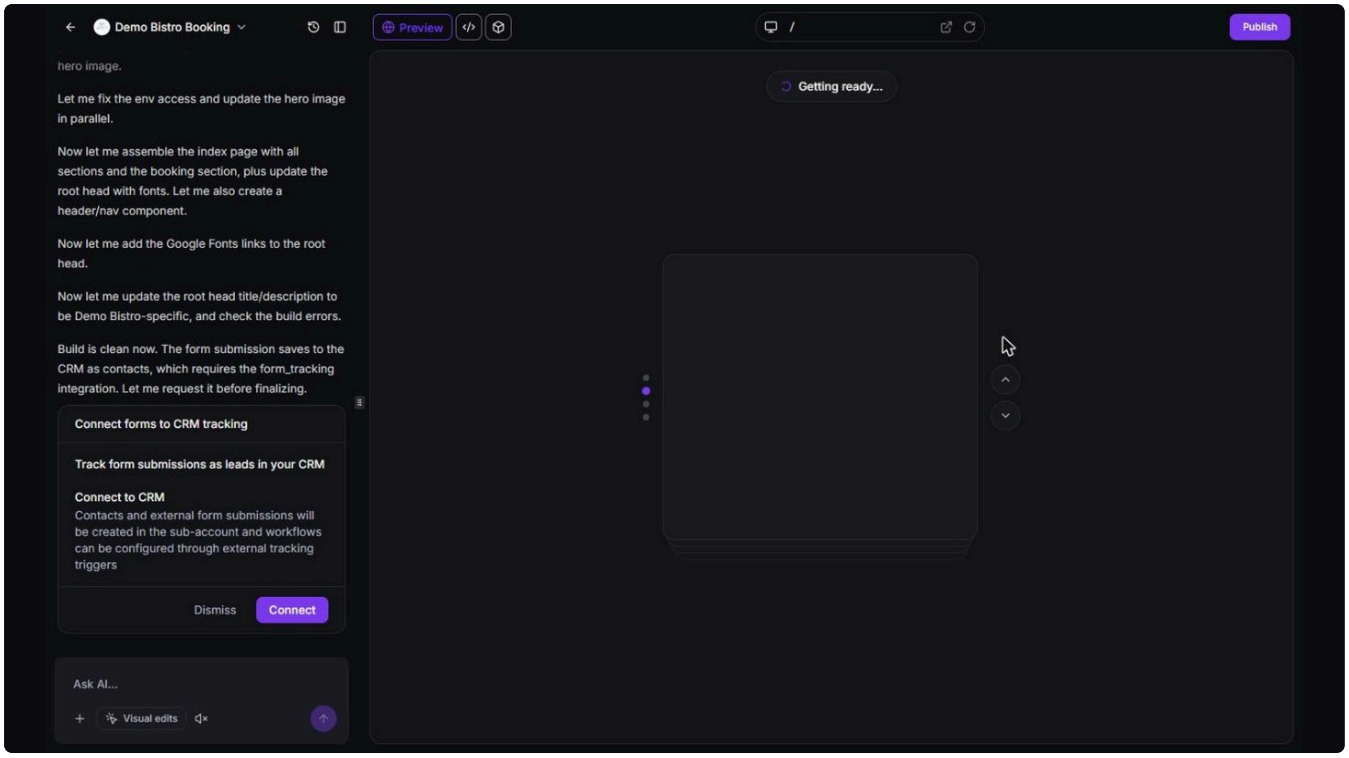

1. **Open AI Studio.** In the sub-account, click **AI Studio (Beta)** in the left menu. Home shows a prompt box, ready-made templates (Landing page, Dashboard, E-commerce, Restaurant, Calendar and more) and a **What's new** button with the latest features.

2. **Write the prompt.** Pick a template or paste one of the prompt samples below. If it is practice, start the prompt with "TEST DEMO (do not publish)" so nobody mistakes it for a live page.
3. **Send and wait.** AI Studio thinks first, then shows a plan as a checklist, for example: set up design system, build page sections, build the form, wire the form to CRM contacts, check mobile. A simple page takes a few minutes.
4. **Click Connect on "Connect forms to CRM tracking".** This is the most important click. It makes every form submission a contact in the CRM. For fields that are not standard (like Preferred Date, Number of Guests or a message), AI Studio registers custom fields for you.
5. **Calendar question.** If the sub-account has calendars, AI Studio may offer to connect one. Click Connect for real bookings, or Dismiss if the form is only for enquiries.
6. **Check the Preview.** Scroll the whole page, switch to the mobile view, and test the buttons. Ask for changes in the chat in plain words, like "make the hero shorter" or "change the button color to coral". Use **Visual edits** for small text fixes.
7. **Do not Publish yet.** Go through the checklist at the end of this guide first.

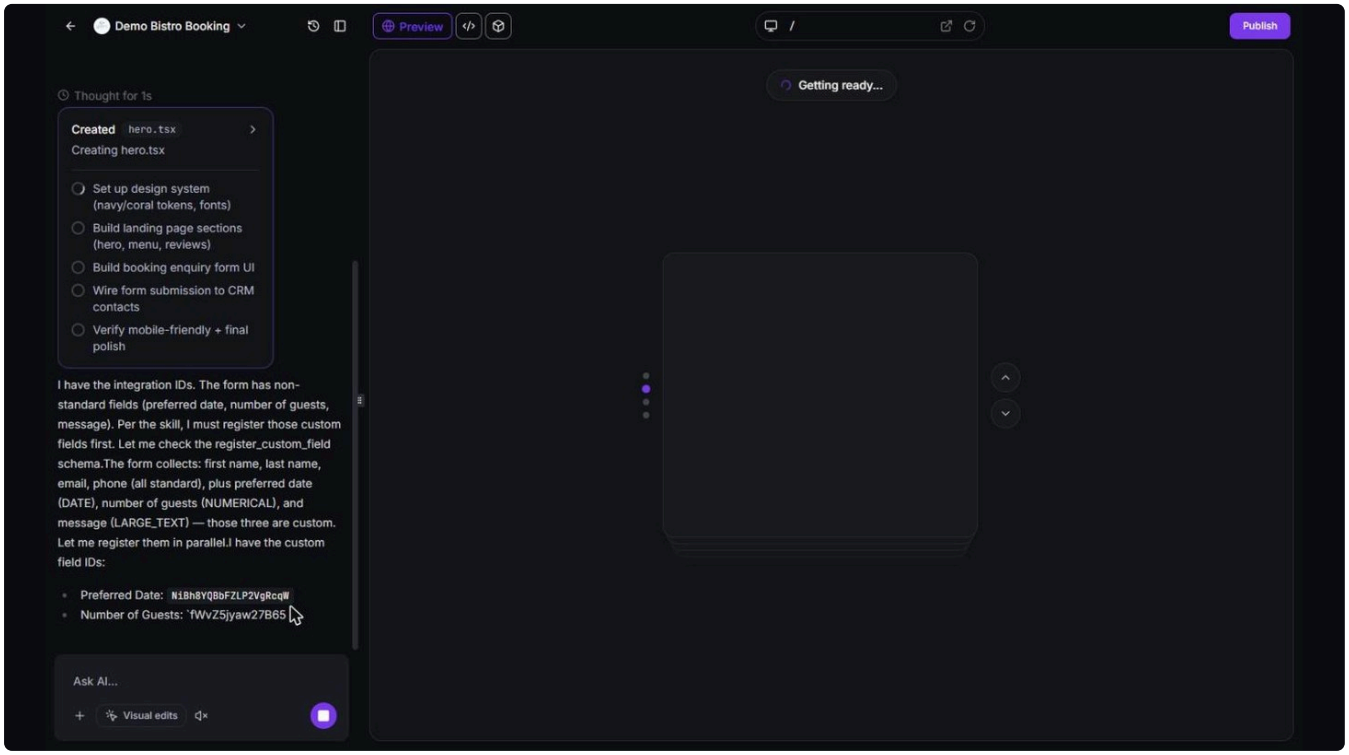

Screenshots from the test build are below: the prompt, the CRM connect step, the finished page and the booking form.

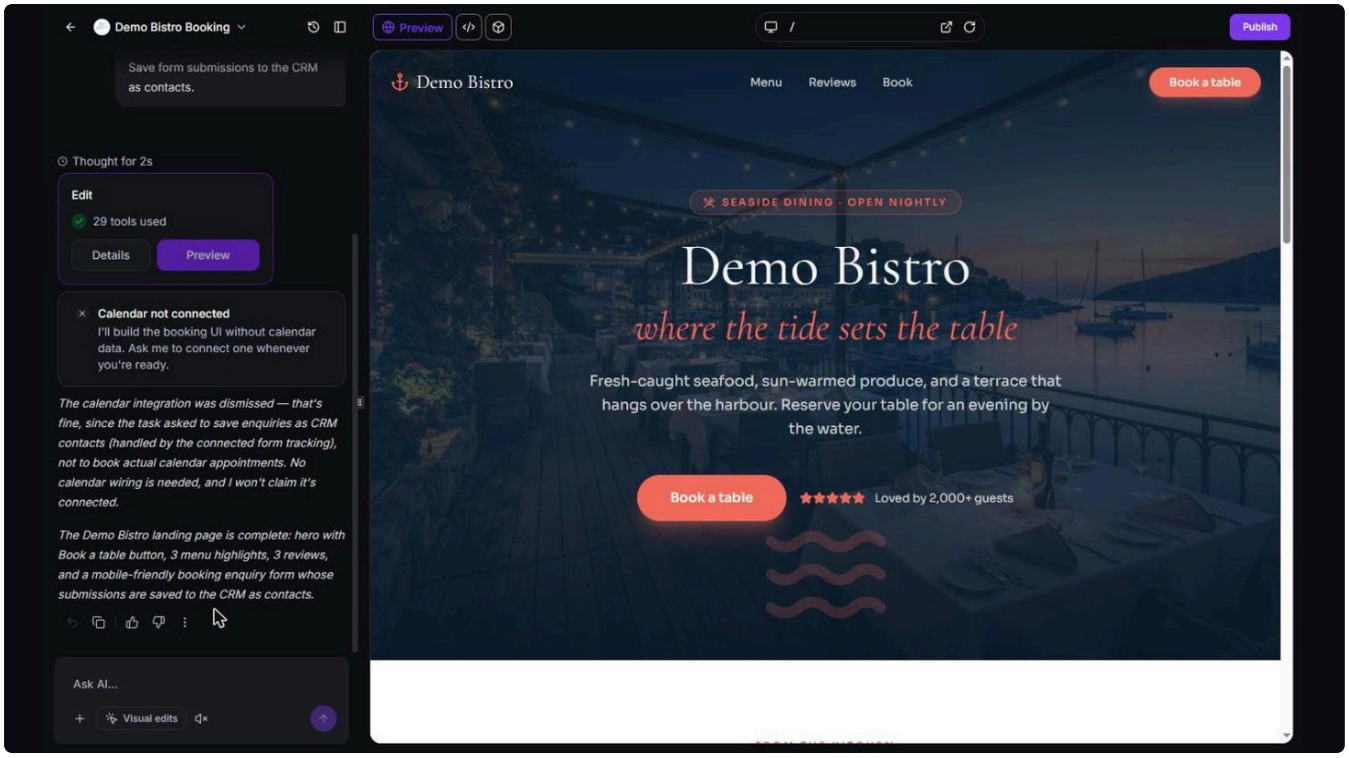

The prompt, starting with TEST DEMO so nobody publishes it by mistake.

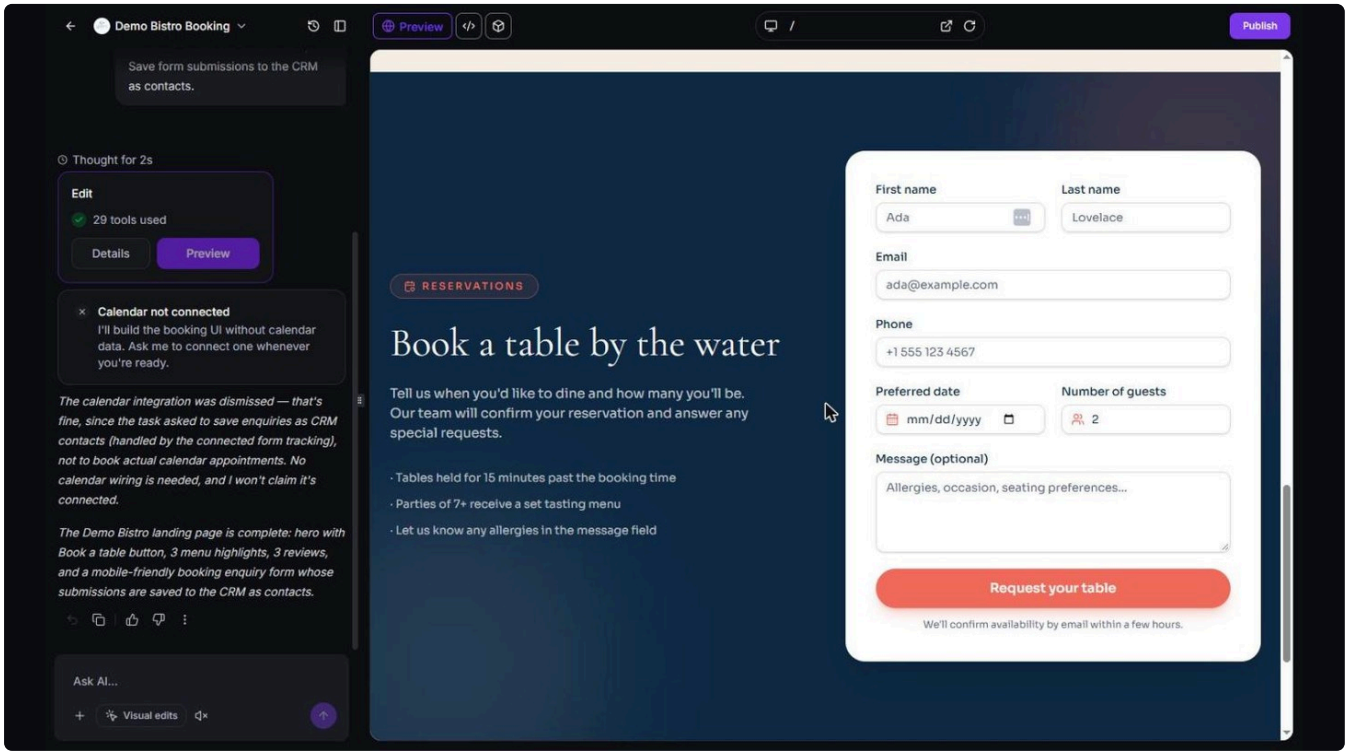

Click Connect here. This is what turns form entries into CRM contacts.

Extra fields like Preferred Date and Number of Guests become custom fields.

The finished page in Preview, built from one prompt.

The booking form: standard fields plus the custom ones.

Prompt samples you can copy

A good AI Studio prompt names five things: the business, the goal of the page, the sections, the form fields, and the brand colors. Then ask for one change at a time.

Restaurant booking page (used in the demo)

```
Build a one-page booking enquiry landing page for a seaside restaurant called Demo Bistro. Sections: hero with headline and a Book a table button, 3 menu highlights, 3 short reviews, and a booking enquiry form with first name, last name, email, phone, preferred date, number of guests and a message. Use navy #0F2A44, a white background and coral #F26B5B buttons. Mobile friendly. Save form submissions to the CRM as contacts.
```

Tradie quote page

```
Build a landing page for a roofing company in Dublin offering a free roof inspection. Sections: headline with the offer and area, 3 benefits, photos of real jobs, 3 Google-style reviews, FAQ, and a quote form with name, phone, email, suburb and type of job. No navigation menu, one call to action repeated at the bottom. Navy #0F2A44, white, orange #F97316 buttons, Montserrat headings and Open Sans body. Save form submissions to the CRM as contacts.
```

Coach lead magnet page

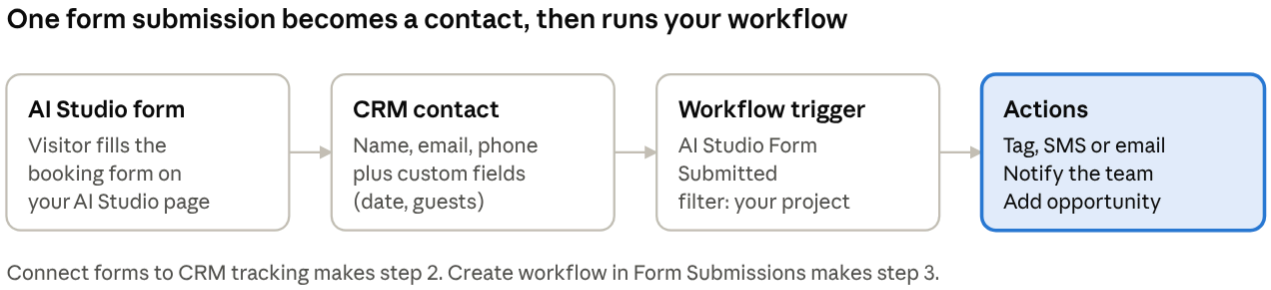

```
Build an opt-in page for a wellness coach giving away a free 7-day calm plan. Headline, 3 bullet benefits, a short bio with photo, and a form with first name and email. After submit, show a thank you message with a Book a free call button. Deep plum #3B1F4A, sand #FAF7F2 background, coral #F26B5B buttons, Playfair Display headings.
```

Follow-up prompts (one change at a time)

- `Make the hero headline shorter and add the suburb: Glenelg.`
- `Move the booking form higher, right under the hero, on mobile.`
- `Make the form fields required except message, and show a friendly error if empty.`
- `After the form is submitted, show: Thanks, we'll confirm your table within 2 hours.`
- `Add a sticky Call now button on mobile with the phone number.`
- `Check the page on mobile and fix any text that is too small or overlapping.`

Tip: say what you want, not how to code it. If a change goes wrong, use the history button to go back instead of stacking more fixes.

Connect the form to the CRM and trigger a workflow

Connect forms to CRM tracking makes step 2. Create workflow in Form Submissions makes step 3.

AI Studio form to workflow · 4 steps

The form does nothing by itself. The CRM connection turns each submission into a contact, and the AI Studio Form Submitted trigger is what starts your follow-up.

1. **Make sure the form is connected.** If you clicked Dismiss on "Connect forms to CRM tracking", type in the chat: "Connect the booking form to CRM tracking so submissions become contacts."
2. **Open Form Submissions.** In the project, click **More**, then **Analytics**, then **Form Submissions**. It is empty at first. The first submission unlocks the **Create workflow** button.
3. **Send one test submission.** In Preview, fill the form with a test name and an example.com email, and press the button. You should see the thank-you message.
4. **Check the submission.** Refresh Form Submissions. You will see a row with the date, the contact, the name and the email. The same person is now a contact in **Contacts**, with the custom fields filled in.
5. **Click Create workflow.** GHL makes a new workflow in Draft with the trigger **AI Studio Form Submitted** ("Runs when a form is submitted on an AI Studio (Vibe) site") and the filter **AI Studio Project is** your project. If the project has more than one form, add a second filter for **AI Studio Form** or **Domain**.
6. **Add the actions.** Click the plus under the trigger and search. Good first actions:
   - **Add contact tag**, for example ai-studio-booking, so you can filter these leads later.
   - **Send SMS** or **Send email** to the lead to confirm you got the request.
   - **Internal notification** to the owner or front desk.
   - **Create/update opportunity** so the lead shows in the pipeline.
7. **Test, then publish.** Use **Test workflow** with your test contact. When it works, switch the workflow from Draft to Publish, then publish the AI Studio site.

Sample confirmation SMS (edit the business name and add custom fields from the merge field picker):

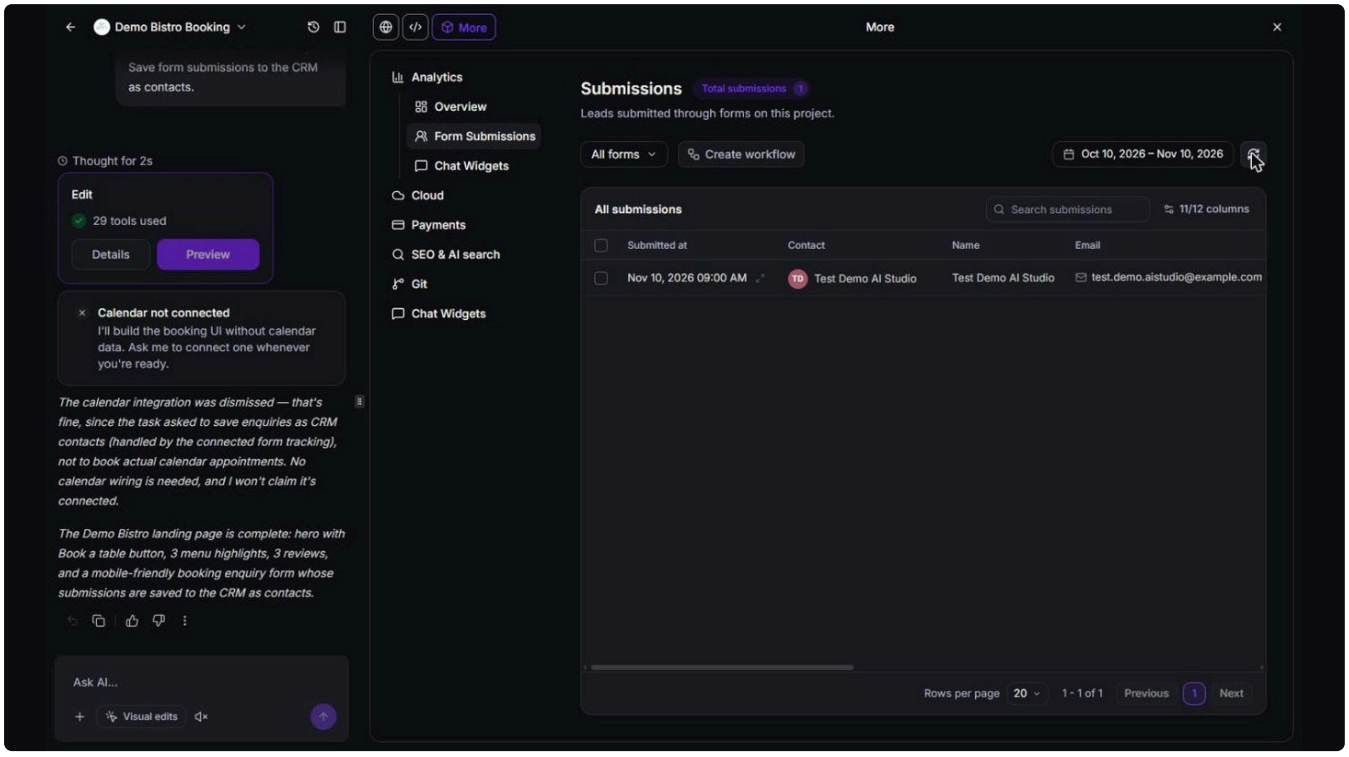

```
Hi {{contact.first_name}}, thanks for your booking request at Demo Bistro! We got your details and our team will confirm your table shortly. Reply here if you need to change anything.
```

Sample internal notification:

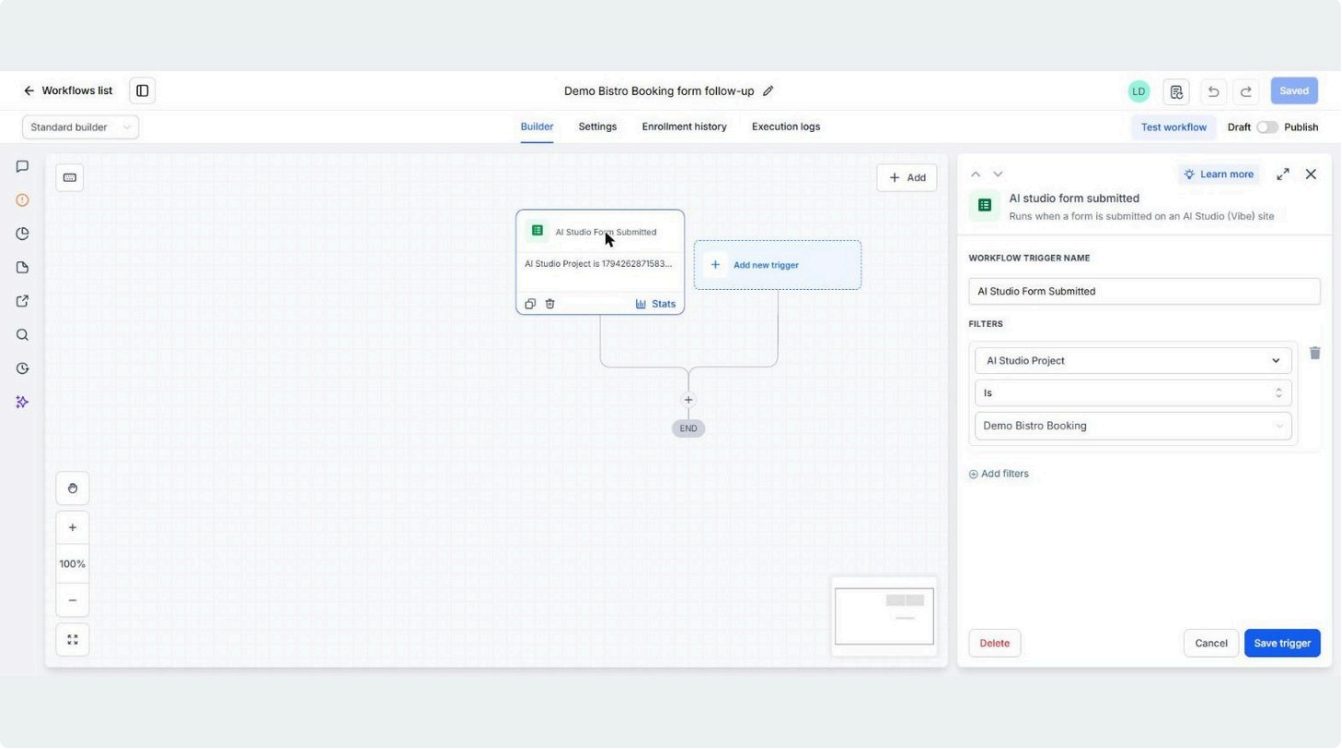

```
New AI Studio booking request: {{contact.name}}, {{contact.phone}}, {{contact.email}}. Please confirm within 1 hour.
```

Note: if you migrate an older project to SSR (a September 2026 update), AI Studio makes a copy. Reconnect form tracking and update the workflow filter to the new project before you publish the copy.

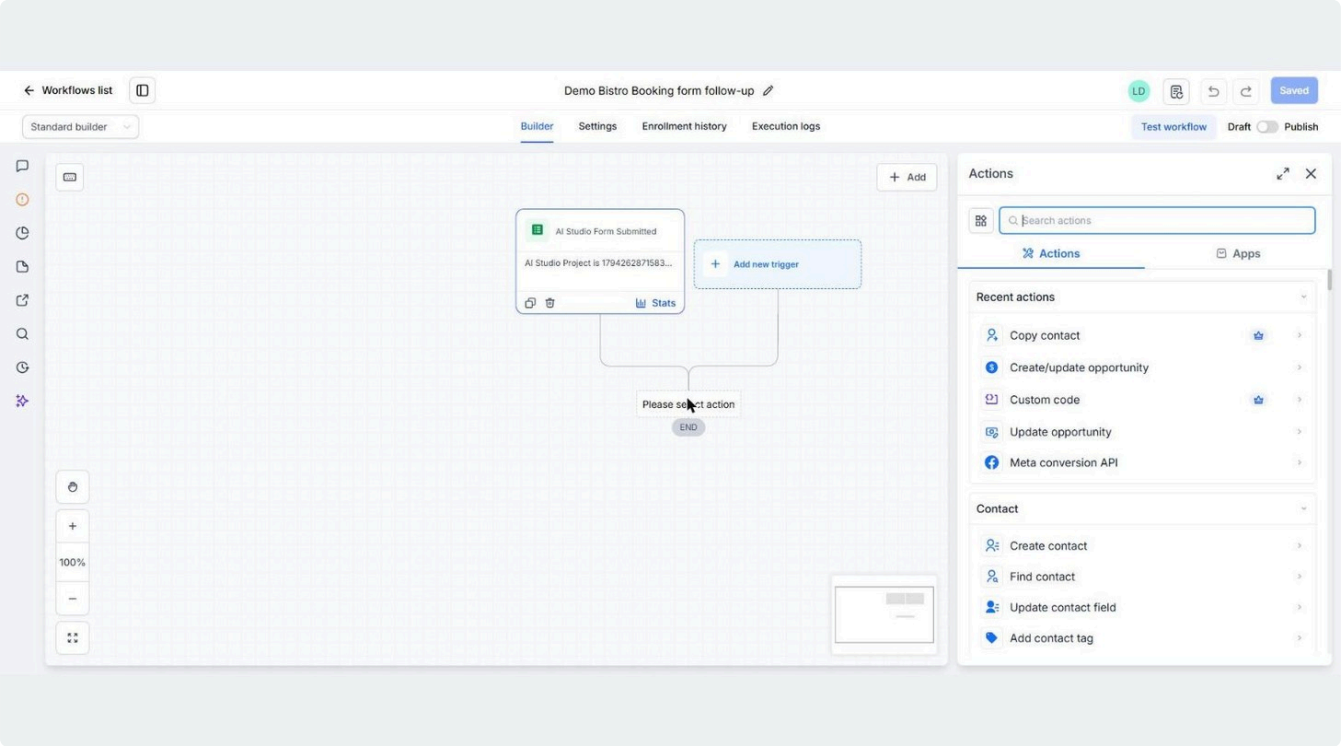

Screenshots below: the submission row, the Create workflow result, the trigger panel and the actions list.

More, Analytics, Form Submissions: the first test entry unlocks Create workflow.

The trigger GHL creates for you, filtered to your project.

Click the plus under the trigger to add tags, SMS, email, notifications and opportunities.

Checklist, common problems and the episodes

Before you publish:

- [ ] Every section and button checked on desktop and mobile

- [ ] Form connected to CRM tracking (a test submission shows in Form Submissions and in Contacts)
- [ ] Custom fields have clear names in Settings, Custom Fields
- [ ] Workflow trigger is AI Studio Form Submitted with the right project filter
- [ ] Workflow tested with a test contact, then switched from Draft to Publish
- [ ] Test contact deleted or tagged as test
- [ ] Domain and SEO title set (More, SEO & AI search)
- [ ] Client approved the page before you click Publish

Common problems:

Problem	Fix
Create workflow is greyed out	Send one test submission first. The first submission unlocks it.
Submissions do not show as contacts	The form is not connected. Ask in the chat to connect the form to CRM tracking.
Workflow does not fire	Check the trigger filter points to the right project, and that the workflow is published, not Draft.
Extra fields are missing on the contact	Ask AI Studio to register them as custom fields, then check Settings, Custom Fields.
Workflow stopped after an SSR migration	The migrated copy is a new project. Reconnect tracking and update the filter.
AI changed things you did not ask for	Be specific in follow-up prompts: name the section and say "change only this".

Watch the episodes (GHL sa Tagalog on YouTube, @ghlvalouie):

- **Ep 41:** AI Studio basics and prompt samples
- **Ep 42:** Connect the AI Studio form to the CRM and trigger a workflow
